

# Contents

Introduction .....	5
1. Small water reservoirs .....	7
2. Reservoir sediments .....	15
3. Technologies used for the non-contact monitoring of the bottom of a water reservoir .....	21
3.1. Global Navigation Satellite Systems (GNSS) .....	21
3.2. Sonar systems .....	29
3.3. Geographic Information Systems (GIS) .....	32
4. Non-contact mapping of the bottom topography of a water reservoir .....	38
4.1. Arrangement of the equipment – building and testing .....	39
4.2. Processing of the collected data .....	42
4.3. Creation of a raster DEM .....	43
4.4. Creation of a TIN model .....	44
5. Use of a raster model for sediment quantification and an assessment of the actual volume of water in a reservoir .....	45
5.1. Monitored water reservoir – Golianovo .....	45
5.2. Principle of the calculation of sediment amount .....	48
5.3. Creation of a raster model of the actual bottom .....	50
5.4. Creation of a raster model of the original bottom .....	58
5.5. Calculation of sediment amount .....	61
5.6. Calculation of water volume .....	63
6. Use of a TIN model for the calculation of the actual volume of water in a reservoir and for the creation of reservoir cross-sections .....	66
6.1. Monitored water reservoir – Koliňany .....	66
6.2. Creation of a TIN model and the calculation of water volume .....	66
6.3. Creation of cross-sections of the reservoir bottom .....	74

7. Assessment of the accuracy of reservoir bottom models .....	79
7.1. Collection and processing of data from direct GNSS measurements .....	81
7.2. Collection and processing of data from GNSS and sonar measurements ..	82
7.3. Creation of a raster model and a TIN model of the reservoir bottom .....	84
7.4. Accuracy assessment of the created reservoir bottom models .....	86
Conclusion .....	89
References .....	92
